

BRAIN-COMPUTER INTERFACE

FOR DEVELOPMENT OF BRAIN-CONTROLLED ASSISTIVE TECHNOLOGY

If you:

- 1 Have limited or no ability to use one or both hands
- 2 Are 22-70 years old
- 3 Live within 2 hours of the University of Chicago

You may be eligible to participate in a research study to determine if long-term recording of brain activity to control a robotic prosthetic arm and other technology for activities of daily living is safe and effective.

You would undergo surgery to place four small electrode arrays in your brain. The wires would pass through your skin so we could record signals to control the arm for 1.5-5.5 years.
